

SELECTED PORTFOLIO

Alexey Martinez

Systems builder working across software, AI, industrial automation, ERP, mobile products, and operations platforms.

Miami / South Florida

English + Spanish

On-site ready

70% to 95%

Timesheet compliance

50% to 90%

Expense compliance

80% to 99%

Process reliability

1 day to 1-2h

Receipt review time

What this PDF is for

A short evidence packet: not every project, not a resume rewrite. The focus is the work that shows ownership - business systems, operational software, mobile product thinking, AI workflow validation, and industrial automation under real constraints.

ERP and operations work

The strongest pattern in the portfolio is not isolated screens. It is turning scattered business processes into systems people can run every day.

Enterprise ERP System

TECHNICAL LEAD / FULL-STACK ENGINEER

Role-based ASP.NET and Angular ERP bringing daily work into one operational platform.

- Leading architecture and delivery with a small engineering team.
- Consoles for employee, manager, admin, developer, purchaser, inventory, engineer, and receiving roles.
- Service logs, time cards, expenses, calendar, purchasing, receiving, inventory, parts, assembly, and support.

Internal Operations Platform

SYSTEMS BUILDER / FULL-STACK ENGINEER

Company-wide React, Node, MSSQL, Docker, and Linux platform replacing spreadsheet-driven workflows.

- Owned frontend, backend, database, auth, deployment, and day-to-day operation.
- Timesheets, expenses, events, deadlines, reporting, RBAC, reminders, and approvals.
- Improved timesheet compliance from about 70% to 95% and expense compliance from about 50% to 90%.

Operating signal

The win is not a prettier dashboard. The win is a business that knows what is happening without another meeting, another spreadsheet, or another person manually checking the same thing twice.

Mobile MVPs and workflow validation

This page shows product thinking: auth, feeds, maps, service discovery, API contracts, AI extraction, human review, and business-facing web surfaces.

Bridge: React Native social and services discovery app

MOBILE / FULL-STACK PRODUCT BUILDER

Private Expo/React Native MVP combining an authenticated social feed with map-based discovery for autism-related services.

- Protected routes, JWT sessions, feed, post creation, comments, likes, and owner edit/delete flows.
- Services tab with city/radius/address search, map cards, Google Places search, and backend data contracts.
- Framed honestly as an MVP: useful product slice first, production hardening next.

AI receipt analysis

Upload, OpenAI analysis, structured fields, and expense matching.

Encore website rebuild

Responsive product storytelling, SEO, media, and contact flows.

Controls Tracker

Workflow modeling for controls engineering visibility and execution.

Robotics, tooling, and process data

Mechanical roots still matter. These projects connect software judgment with robot behavior, physical tooling, operators, validation, and production constraints.

Robotic Sealing and Skiving Tool

PRODUCT DEVELOPMENT / ROBOTICS SYSTEMS

Patent-pending robotic sealing/skiving solution for automotive manufacturing.

- Tooling, FANUC robot behavior, process validation, stakeholder demos, and plant support.
- Reduced sealing cycle time by about 50%.
- Deployed across multiple plants in the U.S. and Canada.

Cap Analyzer (UV Sealer)

PYTHON DEVELOPER

Desktop Python tool connected to a FANUC UV sealer robot.

- Captured load-cell traces, pass/fail outcomes, and searchable batch history.
- Improved process reliability from about 80% to 99%.

Industrial Automation Platform

FULL-STACK ENGINEER

Work-in-progress React/Node/Socket.IO platform for PLC and robot visibility.

- Live tag monitoring, watched tags, websocket dashboards, and backend-owned device communication.
- Designed with safety boundaries: browser views, server-mediated controls.

How I build

I work best where the problem is real, the users are close, and the system has to survive daily use.

01 Start with the bottleneck

Separate the business problem from the user pain before choosing a technology.

02 Build a useful slice

Ship the smallest version that can prove whether the workflow is right.

03 Keep ownership visible

Make roles, permissions, status, and next actions easy to see.

04 Measure what changed

Compliance, reliability, review time, cycle time, uptime, and adoption matter more than feature count.

05 Use AI pragmatically

Apply AI to speed analysis, testing, review, and implementation while keeping architecture decisions human-owned.

Selected stack

React

Angular

Next.js

TypeScript

Node.js

Express

ASP.NET Core

SQL Server

MongoDB

Docker

Linux

Nginx

GitHub Actions

Expo

React Native

OpenAI

FANUC

Socket.IO
